

NEW FACE OF PERGOLA

We have achieved perfect harmony between the high-strength aluminium construction of our bioclimatic systems and the advanced PVC membrane pergola mechanism.

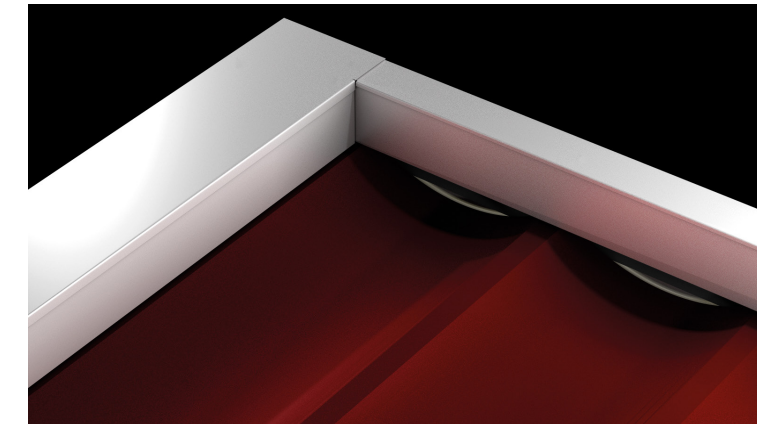

As a result, we created the Retractable Flat Pergola – a new generation of pergola design where innovation meets elegance and functionality.

FLAT ROOF STRUCTURE

The one-way curvature applied to the fabric in a non-sloping structure effectively directs water flow toward the integrated drainage system.

This smart structural approach eliminates the need for a visible roof incline, allowing for a flat and modern design aesthetic while still ensuring proper water management. Additionally, the controlled flow of air through the system contributes to natural ventilation, enhancing overall comfort in the covered space.

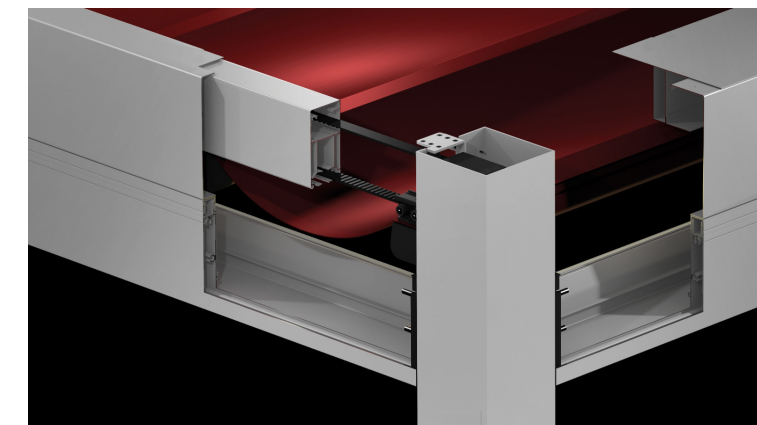

INTEGRATED DESIGN & AESTHETIC FINISH

Aesthetic appearance and ease of installation are achieved through specially designed profiles and fasteners that seamlessly integrate with the overall construction.

These components not only contribute to a clean and refined visual finish but also simplify the assembly process, reducing installation time and ensuring structural consistency.

Their compatibility with the main frame enhances stability, while maintaining the modern, minimalist design expected from high-end pergola systems.

EXPANDED LIVING AREAS

The system's zero-slope design offers a refined structural solution that eliminates the need for visible inclines, creating a cleaner and more open environment.

This unique feature maximises headroom and spatial flow, making your seating areas feel noticeably more spacious, comfortable, and inviting.

Ideal for both residential and commercial settings, it enhances the overall user experience without compromising on style or functionality.
